

爬蟲基礎入門-Part 2

Python 安裝

Windows

<https://www.python.org/>

Ubuntu

```
sudo apt-get install python3.6
```

Mac

<https://docs.python-guide.org/en/latest/starting/install/osx/>

Python 版本

Python 2 vs. Python 3?

為什麼用Python 2

許多函式庫尚未完成 Python 3 的移植

Python 2 最後一個開發版本將維持在 2.7.10，並且不會再有新版（不再加新功能），除非有重大安全才會釋出安全更新版。

為什麼用Python 3

更強大更方便的語法

更強大更方便的函式庫

Python 3 是目前官方持續開發（加新功能）的版本。

基本輸入輸出

基本輸出：print()

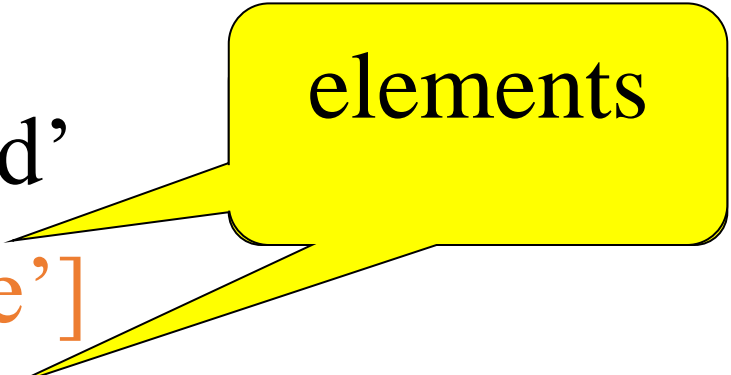

```
1 school="CKSH"
2 year=2013
3
4 #可以用 , 分隔多個變數一起輸出
5 print("Hello", school, year, "!")
6 #預設 分隔,結束 分別為 sep=' ', end='\n'
7 #你可以修改成你想要的
8 print("Hello", school, year, "!", sep='_', end='\nend\n')
9
10 for_pause = input("press enter to exit")
```

小知識：python的註解

- 單行註解：#之後到換行為止都是註解（所以最多註解單行）
- 多行註解：利用多行字串 """ ... """

```
1 num = 1246
2 #我是註解喔^^
3 print( 1246*3 ) #我也是註解:3
4 """
5 我是多行註解 ^.<
6 第二行
7 第三行
8 """
```

Built-in DataTypes

- Number 7, 11.0
 - String 'Hello World'
 - List [7, 11, 'store']
 - Dictionary {'name': 'marr', 'home': 'taipei'}
 - Set set([7, 11, 'store'])
- 

int

整數

新增整數變數、四則運算

Elementary arithmetic

```
1 num1 = 2
2 num2 = 5
3 print( num1.__class__ ) #只是確認看看是不是 "int"
4 print( num2.__class__ ) #同上
5
6 print( "num1+num2=", num1+num2 )
7 print( "num1-num2=", num1-num2 )
8 print( "num1*num2=", num1*num2 )
9 print( "num1/num2=", num1/num2 ) #注意這裡不是無條件捨去
10 print( "num1//num2=", num1//num2 ) #無條件捨去
11 print( "num1%num2=", num1%num2 )
12 print( "num1**num2=", num1**num2 )
13
14 for_pause = input('Press enter to exit')
```

指定運算子 =

#可以一次多個指定

```
n, name, f = 5, "rock", 1.02**10
```

```
print(n, name, f)
```

```
for_pause = input("press enter to exit")
```

Number

String

List

Dictionary

Set

string

字串

'H'	'a'	't'	's'	'u'	'n'	'e'	'M'	'l'	'k'	'u'
-----	-----	-----	-----	-----	-----	-----	-----	-----	-----	-----

新增字串變數、加乘運算

string operation

```
1  #單引號 或 雙引號都是string
2  #可以視字串值是否包含單雙引號決定要用哪種
3  name='Christina'
4  item="Steins;Gate"
5  action="is opened."
6
7  #加法就是字串串接
8  sentence = name + "'s " + item + ' ' + action
9  print( sentence )
10
11 #乘法=做很多次加法
12 print( (name+'! ')*3 )
13
14 for_pause = input("press enter to exit")
```

String

Control Flow

程式流程控制：if、while

Code Indenting

- No explicit begin or end
- No curly braces

```
if age > 18:  
    print("You are old enough.")  
else:  
    print("You are too young.")
```

if Statements

- ```
x = int(raw_input("Please enter an integer: "))
if x < 0:
 x = 0
 print('Negative changed to zero')
elif x == 0:
 print('Zero')
elif x == 1:
 print('Single')
else:
 print('More')
```

## For Statements

- `words = ['cat', 'window', 'defenestrate']`
- `for w in words:`  
    `print( w, len(w))`  
    → `cat 3 window 6 defenestrate 12`
- `range(5, 10)` → `[5, 6, 7, 8, 9]`
- `range(0, 10, 3)` → `[0, 3, 6, 9]`
- `xrange` vs. `range`
- `for i in xrange(10):`  
    `print (i)`  
    → `0 1 2 3 4 5 6 7 8 9`

## while Statements

- ```
x = 0
while x < 10:
    print x,
    x += 1
```

→ 0 1 2 3 4 5 6 7 8 9

Number

String

List

Dictionary

Set

Data Structure

資料結構：List、Dictionary、Set

Number

String

List

Dictionary

Set

List

- `squares = [1, 4, 9, 16, 25]`
- `len(squares) → 5`
- `squares[-1] → 25`
- `squares[-3:] → [9, 16, 25]` # slicing returns a new list
- `squares[:] → [1, 4, 9, 16, 25]` # slicing returns a new list
- `squares + [36, 49] → [1, 4, 9, 16, 25, 36, 49]`
- `squares.append(36) → [1, 4, 9, 16, 25, 36]`
- `squares[2:3] = [] → [1, 4, 25]`
- `squares[:] = []`
- `x = [['a', 'b', 'c'], [1, 2, 3]]`

Number

String

List

Dictionary

Set

Dictionary

- `tel = {'jack': 4098, 'sape': 4139}`
- `tel['guido'] = 4127`
→ `tel = {'jack': 4098, 'sape': 4139, 'guido': 4127}`
- `del tel['sape']`
→ `tel = {'jack': 4098, 'guido': 4127}`
- `tel.keys()`
→ `['guido', 'irv', 'jack']`
- `'guido' in tel`
→ `True`

- `basket = ['apple', 'orange', 'apple', 'pear', 'orange', 'banana']`
- `fruit = set(basket)` *# create a set without duplicates*
- `'orange' in fruit` → `True`
- `a = set('abracadabra')`
→ `set(['a', 'r', 'b', 'c', 'd'])`
- `a = set('abc')` `b = set('ade')`
- `a - b` → `set(['c', 'b'])`
- `a | b` → `set(['a', 'c', 'b', 'e', 'd'])`
- `a & b` → `set(['a'])`
- `a ^ b` → `set(['c', 'b', 'e', 'd'])`

function

函式（函數）

Function Example

```
def myFunc(a, b, c):  内部變數要讓外部也知道的參數
```

```
    global r
```

```
    x = a + 1
```

```
    y = b + 2
```

```
    z = c + 3
```

```
    r = x**2+y**2+z**2  
    return x, y, z
```

内部變數

```
Print(r)
```
